                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            when considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but both have increased expression in tumours. RAGE polypeptides AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis via administration of a therapeutically effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is the amino acid sequence of a fragment of the human soluble Receptor for Advanced Glycation Endproducts (RAGE). RAGE interacts was range of physiologically and pathophysiologically relevant ligands
                                         Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular

                                                                                                                           This is a human advanced glycosylation end-product receptor (RAGE) polypeptide (318 amino acid residues). The RAGE polypeptides and its active fragments or their mimetics, inhibit interaction between advanced glycosylation end-products (AGE) and a receptor (specifically RAGE). The are used to treat diseases associated with AGE/RAGE interaction, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Advanced glycosylation vascular permeability; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, occlusive vascular disorders, neuropathy, nephropathy, retinopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          glycosylation end product (RAGE) polypeptide. The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular
                         disorders such as neuropathy, nephropathy, retinopathy or atherosclerosis) or haemodialysis-associated amyloidosis,
                                                                                                                                                                                                                                                                                                      Claim 3;
                                                                                                                                                                                                                                                                                                                                                   New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabetes etc., also for purification and to screen for modulators

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         age-related disorders such as oxidative stress. These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture and to screen for compounds that are agonists and antagonists of AGE/RAGE interaction. They can also be used diagnostically to detect abnormal levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RAGE levels, and as inhibitors of interaction between AGE and RAGE or other receptors and for purification and quantification of RAGE polypeptides. The encoding nucleic acids are used to express recombinant RAGE and as probes for isolating related
                                                                                                                                           considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but
                                                                                                                                                                                     This is the amino acid sequence of the human soluble Receptor for Advanced Glycation Endproducts (RAGE). RAGE interacts with a range physiologically and pathophysiologically relevant ligands when
                                                                                                                                                                                                                                                                                                                         WPI;
                                       amount of the pharmaceutical composition containing a RAGE polyper
The invention also relates to a method for evaluating the ability
agent to inhibit tumour invasion in a local cellular environment.
                                                                                  both have increased expression in tumours. RAGE polypeptides AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis via administration of a therapeutically effective invasion and metastasis via administration of a therapeutically effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               genes.

The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, haemodialysis associated amyloidosis or atheroselerosis. The Ab can also be used for the collection of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a soluble human receptor to an advanced glycosylation end product (RAGE) polypeptide. disorders such as neuropathy, nephropathy, retinopathy or atherosclerosis) or haemodialysis-associated amyloidosis, also activation of microglial cells by beta-amyloid peptides in Alzheimer's disease or age-related disorders such as oxidative stress. These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture and to screen for compounds that are agonists and antagonists of AGE/RAGE interaction. They can also be used diagnostically to detect abnormal levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RAGE levels, and as inhibitors of interaction between AGE and RAGE or other receptors and for purification and quantification of RAGE polypeptides. The encoding nucleic acids are used to express recombinant RAGE and as probes for isolating related
                                                                                                                                                                                                                                                                                                                        glycosylation end products (AGE) and a receptor (specifically RAGE). They are used to treat diseases associated with AGE/RAGE interaction, such as increased vascular commandation.
                                                                                                                                                                                                                                                                                                                                                                 This is a human advanced glycosylation end-product receptor (RAGE) polypeptide (340 amino acid residues). The RAGE polypeptides and its polypeptide (advantage) active fragments or their mimetics, inhibit interaction between advantage of the polypeptides and the polypeptides are the polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabetes etc., also for purification and to screen for modulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Advanced glycosylation end-product receptor; vascular permeability; diabetes mellitus; translatheimer's disease.

                                                                                                                                                                                                                                       Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes novel isolated peptides (I) having an CC amino acid sequence corresponding to an amino acid sequence of a CC v-domain of a receptor for an advanced glycation end product (RAGE). CC Also described are methods for: (1) inhibiting an amyloid-beta peptide (C (ABP) interaction with a receptor for RAGE when the receptor is on the CC surface of a cell; (2) inhibiting degeneration of a neuronal cell; (3) inhibiting formation of an ABP fibril on a cell; (4) inhibiting cell into senile plaques; (7) inhibiting infiltration of a gargegation of ABP on the surface of a cell; (5) inhibiting activation of a microglial cell into senile plaques; (7) inhibiting activation of a microglial cell by an ABP; (8) treating a subject with a condition cassociated with an interaction of an ABP with a receptor for RAGE on a cell; (10) evaluating the ability of an agent to inhibit binding of an ABP with a v-domain of a receptor for RAGE on the surface of a cell; (10) cell in a cell into senile plaques; (7) inhibiting an the cell; (10) cell in a cell into senile plaques; (7) inhibiting an activation of an ABP with a receptor for RAGE on the surface of a cell; (10) cell in a cell into a cell into senile plaques; (7) inhibiting an RAGE interaction of an RAGE with a subject with a cendition associated with an interaction of cell interaction of an RAGE with a receptor for RAGE on a cell. The methods cell interaction of an RAGE with a receptor for RAGE on a cell. The methods can be used for treating conditions associated with an interaction of an BBP or an RAGE with a receptor for RAGE on a cell interaction of an CC ABP or an RAGE with a receptor for RAGE on a cell interaction of an CC and cytotoxicity, Down's syndrome, dementia associated with head conditions and anyotrophic lateral sclerosis, multiple sclerosis, amyloidosis, an unital disease. Inflammation, a tumour cancer.
                                                                                                                                RESULT
                                                                                                                                                                                                                                                                                    Matches

CC (ABP) interaction with a receptor for RAGE when the receptor is on the curriace of a cell; (2) inhibiting degeneration of a neuronal cell; (3) cc inhibiting formation of an ABP ilbri on a cell; (4) inhibiting cc extracellular assembly of an ABP into a fibril; (5) inhibiting infiltration of aggregation of ABP on the surface of a cell; (6) inhibiting activation of a microglial cell by an ABP; (8) treating a subject with a condition cc associated with an interaction of an ABP with a receptor for RAGE on a cell; (9) evaluating the ability of an agent to inhibit binding of an CC eal; (9) evaluating the ability of an agent to inhibit binding of an CC aBP with a v-domain of a receptor for RAGE on the surface of a cell; (10) cl inhibiting activation of a NF-kappaB gene in a cell; (11) inhibiting condition associated with an receptor for RAGE when the receptor is on the surface of a cell; (10) cl interaction of an RAGE with a condition associated with an ccl interaction of an RAGE with a receptor for RAGE on a cell. The methods can be used for treating conditions associated with an interaction of an RAGE with a receptor for RAGE, e.g. diabetes, Alzheimer's conserved and contact of its associated with head contained mune disease, inflammation, a tumour cancer male importance.

                                                                                                                                                                                                                     CC outgrowth, generate reactive oxygen intermediates, induce cellular considers tress, lead to neuronal cytotoxcity, and promote microglial cactivation. The 50 kDa protein was purified from rat epthelial cells and cis shown to be virtually identical to a bovine receptor for the advanced glycosylation end product. Peptides derived from the amyloid beta cepturises an agent capable of inhibiting interaction. This composition comprises an agent capable of inhibiting interaction of an amyloid beta cepturises an agent capable of inhibiting interaction of anyloid beta comprises an agent capable of carrier. A method for inhibiting interaction on the surface of a cell comprises contacting the cell with e.g. present peptide. Depending on the type of cell, inhibiting the interaction between the amyloid beta peptide of amyloid beta peptide fibril on a cell, inhibiting aggregation of an amyloid beta peptide into a fibril, inhibiting aggregation of a cell, inhibiting aggregation of a cell, inhibiting aggregation of a cell, inhibiting activation of an incroglial cells by amyloid beta peptide. The methods can be used for treating e.g. diabetes, Alzheimer's Disease, senility, renal failure, cellement associated with head tranna. amyotorbic lateral scherars of a cell admonstration of a cell with the methods can be used for the cells by admit a stranger of a cell, inhibiting activation of a cell with head tranna. amyotrobic lateral scherars of a cell chements as colated with head tranna. amyotrobic lateral scherars of a cell chements.

The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (RAGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculapathy, occlusive vascular disorders, neuropathy, nephropathy, retinopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for the isolation and purification of human RAGE polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

                                                                                                                                                                                                                                                                                                                                                                                              CC This is a peptide fragment of a human advanced glycosylation end-product CC receptor (RAGE) polypeptide. The RAGE polypeptides and its active CC fragments or their mimetics can inhibit interaction between advanced CC glycosylation end-products (AGE) and a receptor (specifically RAGE). They care used to treat diseases associated with AGE/RAGE interaction, such as CC increased vascular permeability, diabetes mellitus (particularly CC complications such as micro- vasculopathy or occlusive vascular CC disorders such as neuropathy, nephropathy, atherosclerosis or CC retinopathy) or haemodialysis-associated amyloidosis, also activation CC age-related disorders such as oxidative stress. These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture and CC to screen for compounds that are agonists and antagonists of AGE/RAGE communoassay reagents for measurement of RAGE levels, and as inhibitors of CC interaction between AGE and RAGE or other receptors and for purification CC used to express recombinant RAGE and as probes for isolating related CC denes.
                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                            of a soluble human receptor to an advanced glycosylation end product (RAGE) polypeptide. The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. maicrovasculopathy, baemodialysis associated amyloidosis or atherosetierosis. The Ab can also be used for associated amyloidosis or atherosetierosis. The Ab can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                       Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular permeability, useful to treat diabetes mellitus

Title: Perfect score: Sequence:

US-09-689-469-5 30 1 AQNITARIGEPLVLKCKGAPKKPPQRLEWK 30

Scoring table: OLIGO Gapop 60.0 , Gapext 60.0

Searched: 100059 segs, 36664827 residues

Word size : 0

Total number of hits satisfying chosen parameters: 100059

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Listing first 45 summaries

Database : SwissProt\_39:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
